

All of the dialog boxes get closed after they are not needed. Is there a way to a dialog box so no cache is fully deleted?

My code is such:

```
Sub CloseDialogBox
```

```
With Browser("Preferences").Page("Preferences")
    If .WebElement("Close").Exist(1) Then
        .WebElement("Close").Click
    End If
End With
```

```
End Sub
```

Next:

On the main dialog screen I select a report name link. In return a smaller dialog box opens with different selections depending on the report. After creating the report the smaller dialog box is closed.

In the past, I never had an issue finding which screen or dialog box to use. I still recognize the correct dialog box 50% of the time. But now, my code just doesn't seem to find the dialog boxes even though it is the same as others that are being found.

I changed the tile property of both browsers to be an RegEx as in "Wisdom.*" and "Preferences.*" (without the quotes) but still when the Preference dialog box gets called up for the second link, the dialog box is not located.

When I use:

```
If Browser("Preferences").Page("Preferences").WebElement("close_window2").Exist then
The first dialog box is found, the second dialog box is not found.
```

When I use

```
Window("Windows Internet Explorer_Pref").Activate
The first dialog box is found, the second dialog box is also found.
```

Main screen:
